

# SecurView® Vulnerability Assessment Service

Maintain the Confidentiality, Integrity, and Availability of Critical Business Assets

## :: RAPIDLY Identify Systems and Applications at Risk

A lack of security assurance is the greatest obstacle to growing your business. Securing the integrity of valuable business assets and transactions is crucial. Organizations require assurance that data, systems and services are protected from intrusions, malicious intent, theft and sabotage. Corporate management, partners and customers require the reassurance that the organization's private information will remain confidential and protected from unauthorized access or use. The SecurView Vulnerability Assessment service facilitates IT's task of assuring that requisite levels of security are applied across the organization.

## :: DISCOVER, Prioritize and Remediate Vulnerabilities

SecurView Vulnerability Assessment Service identifies misconfigured and/or unconfigured firewalls, operating systems, network devices, and software as well as bugs, back doors, and obsolete product versions. The SecurView Vulnerability Assessment Service compiles a comprehensive portrait of your network security by applying a collection of process methodologies and tools. To ensure reliability, tests are applied repeatedly for all known vulnerabilities to produce a structured report that allows for consistent comparison of results over time. SecurView Vulnerability Assessment Service generates a detailed report prioritizing risks and recommends actions to prevent their exploitation. Upon completion, a written report is provided explaining the tests performed, the vulnerabilities discovered, and corrective actions to secure the discovered vulnerability.

Feature Offerings	
Service Feature	Benefits
Discover	<ul style="list-style-type: none"> <li>• Up-to-date database consisting of thousands of known vulnerabilities</li> <li>• Structured testing methodology that provides consistent and reproducible results</li> </ul>
Prioritize	<ul style="list-style-type: none"> <li>• Delivers prioritized vulnerability signatures, allowing administrators to take proactive measures to effectively repair systems and applications most at risk</li> </ul>
Remediate	<ul style="list-style-type: none"> <li>• Detailed remediation recommendations to assist with resolving the most critical risks</li> </ul>

### KEY MESSAGES

- :: 99% of all intrusions can be attributed to known vulnerabilities
- :: Cost-effectively protect systems and applications
- :: Up-to-date vulnerability database and remediation information
- :: Reporting and analysis to make informed security decisions, policy adjustments, and prioritize corrective actions
